

Release Notes for the TelluCare product family

Hi,

We are happy to inform you that the TelluCare product family version 6.9 has now been released 😊

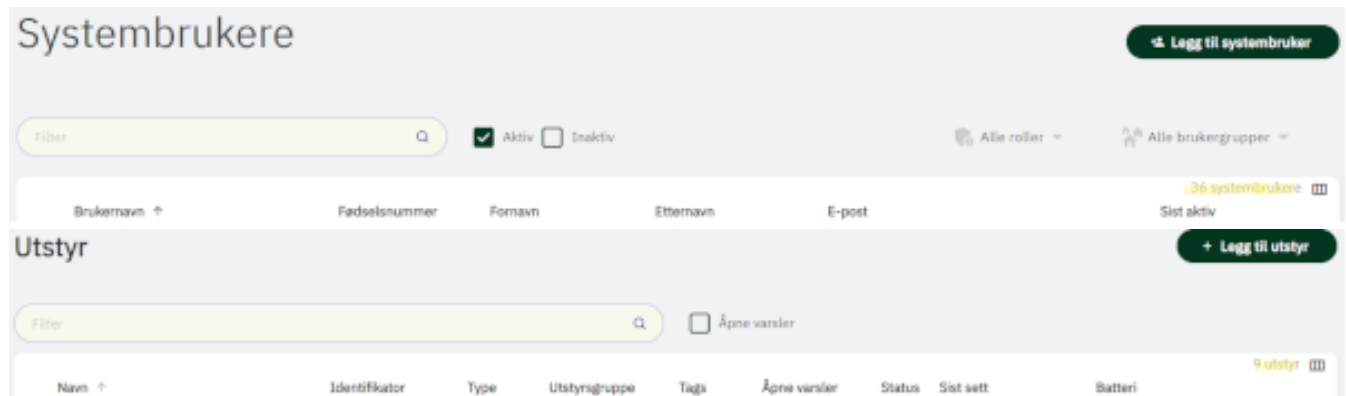

TelluCare - Improvements of org and access control

We have made some improvements for org and access control for devices connected to patients. This makes it possible to set up one main overview of all devices for an account/municipalities on a top level of the organization. At the same time personnel with access to only one zone/department still will have access to relevant equipment connected to patients in the same department. Here shown with ex. with one equipment list for all departments on “Tellu Sykehjem” and on equipmentlist for all departments in “Tellu Bofellesskap”:

TelluCare - Counter for equipment and personell lists

When listing equipments and personell, the count of items is shown.

The release also contains bugs and improvements including the following:

- Keeps page information when going back to the patient list in RPM
- Shows a message to the user when trying to access a deleted patient
- Fixed missing/wrong texts in DHO
- Video meeting request task does not show the text the patient has written in the request
- Can only send a message if proper role
- Filter for DHO gateway list now works correct
- Only roles with write access on patients can add/remove external id on patients

We appreciate your feedback on this release.

Best regards from
Tellu Product and DevOps teams
